The Computational Grid and DIET

- Grid platforms
 - heterogeneous computational resources
 - irregular network topologies
 - dynamic resource performance
- DIET philosophy and design principles
 - server and broker agent model
 - hierarchical organization
 - flexible deployment options

Communication infrastructure

- CORBA-based model
- omniORB implementation

A B + A B +

Advantages and Limitations

Advantages:

- scalability: hierarchy enables parallel server interrogation and distributed scheduling of requests
- straighforward interface: just the name and the correct number of arguments are needed
- abstraction: distributed platform details are largely hidden

Advantages and Limitations

Advantages:

- scalability: hierarchy enables parallel server interrogation and distributed scheduling of requests
- straighforward interface: just the name and the correct number of arguments are needed
- abstraction: distributed platform details are largely hidden

Limitations:

- deployment of appropriate hierarchies for a given grid platform is non-obvious
- limited consideration of inter-task factors
- non-standard application-specific performance measures

Design Implementation Current Status (Near-)Future Work

Plugin Scheduling Enhancements

DIET hieararchy:

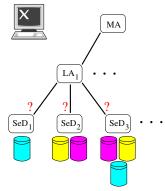

Example: Client request for comparison operation on blue database

• request arrives at SeD level

Design Implementation Current Status (Near-)Future Work

Plugin Scheduling Enhancements

Example: Client request for comparison operation on blue database

- request arrives at SeD level
- only positive responses need to be propagated through the hierarchy

Design

Plugin Scheduling Enhancements

Example: Client request for comparison operation on blue database

- request arrives at SeD level
- only positive responses need to be propagated through the hierarchy
- simple example: client gets random choice of two feasible servers
- more realistic: other factors used to decide
 - processor speed, memory
 - database contention
 - future requests

- A 3 N

Design Implementation Current Status (Near-)Future Work

Implementation Mechanisms

What mechanisms are needed to implement this framework?

- SeD-level (response to client request)
 - interrogate the system performance
 - store selected performance metrics
- Agent-level (aggregation of server responses)
 - collect server responses and extract stored performance estimates
 - order responses from children, based on provided metrics
 - forward ordered responses to next higher level

・ 同 ト ・ ヨ ト ・ ヨ ト

Design Implementation Current Status (Near-)Future Work

SeD-level Interface

Estimation Vector

- Dynamic array of estimation values:
 - tag (byte) + value (float)
 - estVector_t new_estVector()
 - int estVector_addEstimation(estVector_t, diet_est_tag_t, double)

-

Design Implementation Current Status (Near-)Future Work

SeD-level Interface

Estimation Vector

- Dynamic array of estimation values:
 - tag (byte) + value (float)
 - estVector_t new_estVector()
 - int estVector_addEstimation(estVector_t, diet_est_tag_t, double)
- Tags and access functions for existing performance metrics
 - FAST/NWS (e.g, int diet_estimate_fast(estVector_t, const diet_profile_t*))
 - SeD execution timestamp (to approximate Round-robin scheduling)

 - estVector_t new_estVector()
 - int estVector_addEstimation(estVector_t, diet_est_tag_t, double)
- Tags and access functions for existing performance metrics
 - FAST/NWS (e.g, int diet_estimate_fast(estVector_t, const diet_profile_t*))
 - SeD execution timestamp (to approximate Round-robin scheduling)
- User-defined tags
- Equivalent CORBA object and marshalling function

Design Implementation Current Status (Near-)Future Work

Agent-level Interface

New Profile Parameters

- New dynamic array of prioritized optimization directives:
 - *tag*: basis for comparison
 - semantics: maximize, minimize, etc.
- At service registration time, directives are fixed
- At runtime, directives used to order server responses

・ 同 ト ・ ヨ ト ・ ヨ ト

Design Implementation Current Status (Near-)Future Work

Modules' Status

Estimation Vector

- Fully functional API for storage of raw values
- Basic library of standard estimators
- Interface for user-defined metrics to be redesigned

DIET Profile Enhancements

- Existing scheduling strategy (i.e., preference for FAST) re-implemented using estimation vector
- User-defined metrics currently ignored
- Providing access to DIET agent hiearchy not previously supported

Design Implementation Current Status (Near-)Future Work

Work in Progress

Near-term Milestones

- Profile parameter extension to support priority optimization
- New performance estimator routines
 - alternative performance measurement systems (e.g., ganglia)
 - emerging DIET functionality (e.g., SeD-level queues)
- Initial plugin scheduler: DIET release 2.0

Open Issues

- Enforcement of optimization strategy over entire hiearchy
- Evaluate need for more expressive aggregation methods
- Incorporate runtime scheduling preferences
