Small scale

Large scale

Meso scale

- Heterogeneity at all scales
- Lack of data

Models and methods must deal with uncertainty: **random data**

*A. Beaudoin et al., WRR 2007, WRR 2008, WRR 2010, WRR 2013*

## Random conductivity field

$$\begin{cases} a(\omega, x) = \exp(Y(\omega, x)) \text{ in } \Omega \times O, \\ \text{cov}[Y](x, y) = \sigma^2 \exp(-(\frac{\|x-y\|}{l})^\delta) \text{ in } O, \end{cases} \quad (1)$$

with  $O$  open domain in  $\mathbb{R}^2$  or  $\mathbb{R}^3$ ,

$\Omega$  probability space,

$Y$  a gaussian field with mean  $\mu$  and covariance  $\text{cov}[Y]$

$\sigma = 1, l = 5$ , 5 orders of magnitude

$\sigma = 3, l = 5$ , 14 orders of magnitude

## Single-phase steady-state flow in a saturated porous medium

Darcy's law and mass conservation law

$$\begin{cases} \theta(x)v(\omega, x) = -a(\omega, x)\nabla p(\omega, x) \text{ in } \Omega \times O, \\ \nabla \cdot (\theta(x)v(\omega, x)) = 0 \text{ in } \Omega \times O, \\ \text{Boundary conditions,} \end{cases} \quad (2)$$

with  $\theta v$  the Darcy velocity,  $p$  the hydraulic head,  
 $\theta$  the porosity,  $a$  the hydraulic conductivity.

HPC

Domain  $L_x = 64, L_y = 32, L_z = 32$ , Gaussian covariance  $l = 5, \sigma = 2$

## Transport by advection-diffusion-dispersion

$$\left\{ \begin{array}{l} \frac{\partial(\theta(x)c(\omega, x, t))}{\partial t} + \nabla \cdot (\theta(x)v(\omega, x)c(\omega, x, t)) - \nabla \cdot (\theta(x)D_v(\omega, x)\nabla c(\omega, x, t)) = 0, \\ \text{boundary conditions,} \\ \text{initial condition,} \end{array} \right. \quad (3)$$

with  $c$  the solute concentration,  $D_v$  the dispersion tensor given by

$$D_v(\omega, x) = (\alpha_T(x) \|v(\omega, x)\| + D_m(x))I + (\alpha_L(x) - \alpha_T(x)) \frac{v(\omega, x)v(\omega, x)^T}{\|v(\omega, x)\|}, \quad (4)$$

with  $D_m(x)$  the isotropic molecular diffusion coefficient,  
 $\alpha_T(x)$  and  $\alpha_L(x)$  the transversal and longitudinal dispersion coefficients.

Evolution of the plume in a log-normal exponentially correlated field in the pure advection case ( $\sigma = 3$ ,  $l = 10$ ,  $\mu = -13.8155$ )

## Simulation of flow and transport with random input data

- PARADIS software with Graphical User Interface
- computation of statistical quantities of interest
- large scale 2D and 3D computations, using High Performance Computing
- distributed computing with MPI communication library

Evolution of the plume by advection-diffusion ( $D_m = 0.005$ ,  $\sigma = 1$ ,  $l = 5$ )

## Spreading and macro-dispersion

$$\left\{ \begin{array}{l} G_k(\omega, t) = \int_{\mathcal{O}} c(\omega, x, t) x_k dx, \\ S_k(\omega, t) = \int_{\mathcal{O}} c(\omega, x, t) (x_k - G_k(\omega, t))^2 dx, \\ D_k(\omega, t) = \frac{1}{2} \frac{dS_k(\omega, t)}{dt}. \end{array} \right.$$

with  $G_k$  the center of mass in direction  $k$ ,  $k = 1, 2, 3$ ,  
 $S_k$  the spreading,  $D_k$  the macro-dispersion.

## Mean spreading and mean macro-dispersion

$$\left\{ \begin{array}{l} S_k(t) = \mathbb{E}_{\omega}[S_k(\omega, t)], \\ D_k(t) = \mathbb{E}_{\omega}[D_k(\omega, t)]. \end{array} \right.$$

## Monte-Carlo method

- Finite number of samples  $S_k(t) \simeq \frac{1}{N} \sum_{i=1}^N S_{i,k}(t)$ ,
- discretization in the physical space for flow and transport computations,
- non intrusive and parallel simulations,
- a priori large number  $N$  of simulations, but fast convergence in an ergodic case (observed in numerical experiments).

*Erhel et al., ParCFD, 2010*

Monte-Carlo loop

- Random generation of streams with RNGSTREAM library,
- embarrassingly parallel loop,
- failure recovery with checkpoints.

and examples  
of results

Numerical  
methods and  
HPC

## One parallel simulation

- Domain meshed with a regular grid with  $N_m$  cubic cells of size  $\Delta x$ ,
- parallel generation of the random conductivity field,
- parallel computation of the flow matrix,
- parallel sparse solving,
- parallel random walker for the transport model.

*Erhel et al., ParCFD, 2008*

Domain decomposition: one  
domain per processor

- Ghost cells for communication,
- overlapping of SEND and RECV non blocking operations,
- number of subdomains fixed by memory requirements.

# Generation of random hydraulic conductivity

$a = \exp(\mu + \sigma Z)$  with  $Z$  normal field with a given covariance function.

## Spectral simulation

- compute the discrete spectral density, using a DFT of the covariance,
- compute the discrete normal field  $Z$ , using an inverse FFT,
- parallel generation with domain decomposition,
- use of FFTPACK library,
- complexity in  $O(N_m \log(N_m))$ .

*G. Lecourt, master thesis, 2012; M. Oumouni et al., Inria preprint, 2014*

Speed-up of random generation

- extended domain for FFT,
- redistribution of data.

## Mixed hybrid finite element method

- local and global mass conservation,
- can deal with anisotropic conductivity,
- can deal with unstructured mesh,
- equivalent to a finite volume method in a regular case,
- sparse symmetric positive definite matrix,
- mesh step  $\Delta x$  and approximate velocity  $\tilde{v}$ ,
- complexity in  $O(N_m)$ .

Physical model  
and examples  
of results

Numerical  
methods and  
HPC

## Matrix condition number

- 2D numerical experiments

Condition number versus matrix size :  
 $O(N)$

Condition number versus  $\sigma$ :  $O(\exp(\sigma))$

## Sparse linear solver

- parallel direct solver for large systems,
- parallel algebraic multigrid for very large systems,
- convergence of AMG independent of heterogeneity,
- almost linear complexity in  $O(N_m)$  of AMG,
- use of HYPRE library: SMG and Boomer-AMG.

*Erhel et al., ParCFD, 2008; A. Baudoin et al., ESAIM Proc., 2013*

CPU time of SMG and AMG for 2D domains

CPU time of AMG for small 3D domains

## Random walker method

- Lagrangian method,
- pure advection case: characteristic method,
- pure diffusion case: Monte-Carlo method,
- no numerical diffusion,
- efficient parallel algorithm.

*Erhel et al., Europar, 2007*

## Fokker-Planck equation

with  $D_v = D_m I$  and  $\theta(x) = 1$ , infinite domain

$$\begin{cases} \frac{\partial c(x,t)}{\partial t} + v(x)\nabla c(x,t) - D_m \Delta c(x,t) = 0, \\ c(x,0) = c_0(x) \end{cases} \quad (5)$$

## Stochastic Differential Equation

$$\begin{cases} dX_t = v(X_t)dt + \sqrt{2D_m}dW_t, \\ X_0 \text{ given} \end{cases} \quad (6)$$

If  $X_0$  admits  $c_0(x)$  as density, then  $X(t)$  admits  $c(x)$  as density.

## Simulation $i, i = 1, \dots, N$

Discrete Flow equation with random data  $a_i$  and approximate velocity  $\tilde{v}_i$

## Euler scheme with approximate velocity $\tilde{v}_i$

$M$  particles  $j = 1, \dots, M$  and time step  $\Delta t$

$$\begin{cases} \tilde{X}_{i,j}(t + \Delta t) = \tilde{X}_{i,j}(t) + \tilde{v}_i(\tilde{X}_{i,j}(t))\Delta t + \sqrt{2D_m\Delta t}\tilde{W}_{i,j}(t), \\ \tilde{X}_{i,j}(0) \text{ given.} \end{cases} \quad (7)$$

## Parallel particle tracker

## Physical parameters

- 3D domain of size  $1024 \times 256 \times 256$
- Log-normal conductivity field Gaussian covariance and  $\mu = 0, \sigma = 1, l = 10$
- Periodic transversal boundary conditions for flow and transport
- Dirichlet longitudinal flow boundary conditions:  $p_{in} = 1024, p_{out} = 0$
- Inflow homogeneous Neumann and outflow homogeneous Dirichlet transport boundary condition
- Molecular diffusion  $D_m = 10^{-3}$

## Numerical parameters

- Computations with PARADIS software using HPC
- Regular mesh with square cells of size  $\Delta x = 1$
- Injection window of transversal size  $0.8 \times 256$  and longitudinal size  $\Delta x$
- Local time step
- Use of 128 cores of a cluster (in Poitiers)

CPU time of random walker versus the  
number of particles

- Random field generation CPU time:  $< 1$  second,
- flow CPU time: about 130 seconds,
- number of V-cycles: in the range [25, 30].

## Spreading and macro dispersion

$$\left\{ \begin{array}{l} G_{i,k}(t) = \mathbb{E}_{\xi} [X_{t,i,k}], \\ S_{i,k}(t) = \mathbb{E}_{\xi} [(X_{t,i,k} - G_{i,k}(t))^2], \\ \\ V_{i,k}(t) = \mathbb{E}_{\xi} [v_k(X_{t,i})], \\ D_{i,k}(t) = \text{trace}(D_m) + \mathbb{E}_{\xi} [X_{t,i,k} v_k(X_{t,i})] - G_{i,k}(t) V_{i,k}(t). \end{array} \right.$$

## Particle Monte-Carlo applied to simulation $i$

$$\left\{ \begin{array}{l} \tilde{G}_{i,k}(t) = \frac{1}{M} \sum_{j=1}^M \tilde{X}_{i,j,k}(t), \\ \tilde{S}_{i,k}(t) = \frac{1}{M} \sum_{j=1}^M (\tilde{X}_{i,j,k}(t) - \tilde{G}_{i,k}(t))^2, \\ \tilde{V}_{i,k}(t) = \frac{1}{M} \sum_{j=1}^M \tilde{v}_{i,k}(\tilde{X}_{i,j}(t)), \\ \tilde{D}_{i,k}(t) = \text{trace}(D_m) + \frac{1}{M} \sum_{j=1}^M \tilde{X}_{i,j,k}(t) \tilde{v}_{i,k}(\tilde{X}_{i,j}(t)) - \tilde{G}_{i,k}(t) \tilde{V}_{i,k}(t). \end{array} \right.$$

## $N$ Monte-Carlo simulations

$$\begin{cases} \tilde{S}_k(t) = \frac{1}{N} \sum_{i=1}^N \tilde{S}_{i,k}(t), \\ \tilde{D}_k(t) = \frac{1}{N} \sum_{i=1}^N \tilde{D}_{i,k}(t) \end{cases}$$

## Theoretical results

with some assumptions

$$\|D(t) - \tilde{D}(t)\|_{L^2_{\omega, \xi}} \leq C(\Delta t^{\frac{1+\alpha}{2}} + \Delta x |\log(\Delta x)| + \frac{1}{\sqrt{N}} + \frac{1}{\sqrt{M}})$$
